

Problem Statements for Hackathon HackNow - 2026

A Note to Hackathon Participants

The ServiceNow components and design elements outlined in each problem statement are provided purely as a starting point and source of inspiration - not as a mandatory blueprint. They represent one possible approach to solving the problem using the ServiceNow platform.

You are completely free and actively encouraged to explore the full breadth of the ServiceNow platform and bring in any modules, applications, technical components, integrations, or Now Platform capabilities that you believe best solve the problem. Whether that means leveraging Now Assist (GenAI), RPA (Robotic Process Automation), Virtual Agent, Predictive Intelligence, Process Automation Designer, Integration Hub, App Engine Studio, or any other ServiceNow capability not mentioned in the problem statement - go for it.

The best solutions will be those that demonstrate creativity, technical depth, real-world impact, and innovative use of the ServiceNow platform - not those that simply check off the listed elements. Think beyond the list. The elements are a suggestion; your imagination is the only real constraint.

International Student Services & Visa Compliance Management

Background:

Universities enroll thousands of international students whose visa status, study authorization, and work permissions must be carefully managed to maintain SEVIS compliance with the U.S. Department of Homeland Security. International student advisors manage complex cases involving I-20 extensions, OPT/CPT work authorization requests, travel signatures, status violations, and reporting requirements. These are currently managed through email, PDF forms, and a combination of SEVIS access and spreadsheets. Students are often confused about requirements and deadlines, and advisors manage large caseloads without structured workflow tools.

Objective:

Design a ServiceNow international student services management platform that provides students with a clear portal for all visa and authorization requests, automates document review and advisor workflows, manages regulatory reporting deadlines, and gives DSO (Designated School Official) teams visibility into compliance status across all active international students.

Elements to include in Design:

- Student Services Portal:** Guided request forms for I-20 extensions, OPT/CPT, travel signatures, and status inquiries
- Advisor Case Management:** Case workspace with student immigration history, document storage, and action tracking
- Regulatory Deadline Management:** Automated tracking of OPT application windows, travel signature expiry, and SEVIS reporting dates
- Document Review Workflows:** Structured intake, review, and issuance workflows for immigration documents
- Notifications:** Deadline reminders for students and advisors, request status updates, and required action alerts
- Knowledge Base:** Comprehensive guides on visa types, work authorization, travel requirements, and enrollment maintenance
- Compliance Dashboard:** Active international student status overview, upcoming deadlines, pending requests, and advisor workload
- ServiceNow AI Agents**

Citizen Services Portal for Local Government – Permit & Complaint Management

Background:

Local government offices receive thousands of citizen requests annually for building permits, zoning inquiries, noise complaints, pothole reports, business license applications, and public records requests. These are currently handled through phone calls, paper forms, emails to individual departments, and disconnected web forms, leading to lost requests, long processing times, inconsistent communications, and no transparency for citizens tracking their request status. Municipal staff in different departments use different systems, making inter-departmental coordination for complex requests difficult and time-consuming.

Objective:

Design a ServiceNow citizen services portal for local government that gives residents a single digital channel to submit all service requests, track real-time status, and receive proactive updates. Internally, the system should route requests intelligently to the appropriate departments, enforce SLAs, facilitate inter-departmental collaboration on complex requests, and provide city leadership with performance dashboards.

Elements to include in Design:

- Citizen Service Portal:** Mobile-responsive self-service interface for submitting and tracking all service requests
- Service Catalog:** Structured forms for permits, complaints, inspections, license applications, and public records requests
- Intelligent Routing:** Business rules to automatically assign requests to the correct department and staff
- Inter-Departmental Collaboration:** Shared case workspace for requests requiring multiple department coordination
- SLA Management:** Response time commitments with automated escalation for overdue items
- Notifications:** Proactive status updates to citizens at each processing milestone via email and SMS
- City Leadership Dashboard:** Service volume by type, average processing times, SLA compliance, and department performance
- Generative AI Controller**
- Virtual Agent Designer**
- Custom Tables**

Refugee & Immigrant Services Navigation & Case Management Platform

Background:

Community organizations supporting newly arrived refugees and immigrants navigate complex service ecosystems including housing assistance, employment services, language programs, healthcare enrollment, legal aid, and school enrollment. Case managers juggle large client caseloads with paper files, email communications, and disconnected service referral processes. Clients have language barriers and no digital tools to understand available services or track their case progress. Service coordination between multiple agencies serving the same family is entirely manual, leading to duplication, gaps in care, and client frustration.

Objective:

Design a ServiceNow refugee and immigrant services case management platform that enables community organizations to manage client intake, coordinate multi-agency service delivery, track case progress and milestones, manage compliance with resettlement agency reporting requirements, and measure outcomes across the service population.

Elements to include in Design:

- Multilingual Client Portal:** Service discovery interface with translation support for common languages
- Client Intake & Assessment:** Structured intake forms capturing household composition, immediate needs, and service eligibility
- Integrated Case Management:** Case workspace tracking active services, appointments, document status, and case notes
- Multi-Agency Referral Management:** Structured electronic referrals with status tracking between partner organizations
- Document Management:** Secure storage for vital documents with controlled case manager access
- Milestone Tracking:** Integration of resettlement milestone requirements with automated reporting to sponsoring agencies
- Outcomes Dashboard:** Population-level metrics on service utilization, housing stability, employment rates, and self-sufficiency progress
- Agentic Workflow:** Integrated Case Management

K-12 School Partnership & Educational Outreach Program Management

Background:

Universities run extensive K-12 outreach programs including STEM workshops, tutoring programs, campus visit days, dual enrollment, and teacher professional development. These programs are managed by multiple colleges and departments independently, with duplicated administrative overhead, inconsistent program quality, and no university-wide view of outreach activity and impact. School district partners struggle to navigate the university's fragmented program offerings and coordinate logistics for multiple programs simultaneously. There is no systematic way to collect and analyze impact data for grant reporting and institutional accountability.

Objective:

Develop a ServiceNow K-12 educational outreach management platform that creates a unified program catalog, streamlines school partnership coordination, manages program registrations and scheduling, tracks student and educator participation, and automates impact reporting for grant compliance and institutional leadership.

Elements to include in Design:

- Partner School Portal:** School district interface for browsing programs, submitting participation requests, and tracking logistics
- Program Catalog Management:** Central registry of all outreach programs across university departments with eligibility requirements
- Registration & Scheduling Workflows:** Automated confirmation, scheduling, and logistics coordination for program participants
- Facilitator Management:** University facilitator assignment, availability tracking, and preparation task workflows
- Participant Tracking:** K-12 student and educator engagement records across all university programs
- Impact Surveys:** Pre and post program surveys for measuring learning outcomes and satisfaction
- Grant Reporting Dashboard:** Participation data aggregation, demographic analytics, and outcome metrics for funder reports
- NowAssist Virtual Agent**

Volunteer Management & Community Engagement Platform for Nonprofits

Background:

Nonprofit organizations and community service programs rely heavily on volunteers but struggle to recruit, schedule, manage, and recognize them effectively. Volunteer coordinators juggle spreadsheets, email chains, and manual phone follow-ups to match volunteer availability with service opportunities, track hours, and maintain compliance with background check requirements. Volunteers themselves have no visibility into available opportunities, their personal contribution history, or recognition for service milestones. This disorganized approach results in high volunteer churn, unfilled service slots, and administrative overload for nonprofit staff.

Objective:

Build a ServiceNow-based volunteer management platform that enables nonprofits to recruit volunteers digitally, manage service opportunities, automate scheduling and communications, track volunteer hours and certifications, and recognize contributions. The platform should reduce administrative burden, improve volunteer retention, and provide leadership with data to measure community impact.

Elements to include in Design:

- Service Portal:** Volunteer self-service hub for browsing opportunities, registering, and tracking hours
- Custom Tables:** Volunteer profiles with skills, availability, certifications, background check status, and service history
- Scheduling Workflows:** Automated matching and assignment of volunteers to service opportunities based on availability and skills
- Notifications:** Shift reminders, scheduling confirmations, and follow-up thank-you messages post-service
- Surveys:** Post-service volunteer feedback to improve program quality and satisfaction
- Recognition Module:** Automated milestone awards and certificates based on cumulative service hours
- Generative AI Controller**
- Virtual Agent Designer**
- Dashboards:** Volunteer program metrics including hours served, participation rates, retention, and community impact

Faculty & Staff Leave Management & HR Case Resolution System

Background:

Human Resources departments at universities handle thousands of inquiries and transactions annually — including leave requests, benefits questions, policy clarifications, performance issue cases, and grievance filings. These interactions currently occur via email, phone, and walk-in visits with no case tracking, inconsistent response quality, and no self-service options. HR staff spend significant time answering repetitive questions that could be deflected by a knowledge base. Faculty and staff have no visibility into the status of their HR requests, and HR leadership lacks data to measure team performance or identify policy areas needing clarification.

Objective:

Implement a ServiceNow HR Service Delivery (HRSD) solution for a university HR department that provides employees with a self-service portal for common HR needs, structures case management for complex inquiries, automates leave request workflows, and gives HR leadership visibility into team performance and service trends.

Elements to include in Design:

- HR Service Portal:** Employee-facing hub for submitting HR requests, accessing policies, and tracking case status
- HR Case Management:** Structured case types for leave requests, benefits inquiries, policy questions, and grievances
- Leave Workflows:** Automated leave request approval routing to managers with HR oversight and calendar integration
- Knowledge Base:** HR policy library with searchable articles on benefits, leave policies, and employee rights
- Employee Document Center:** Secure access to personal HR documents including pay slips and offer letters
- Notifications:** Status updates, approval decisions, and action reminders throughout case lifecycle
- NowAssist for HRSD**
- Reporting:** HR case volume, resolution times, deflection rates, and top inquiry categories

Patient Care Coordination & Clinical Workflow Automation

Background:

Large multi-specialty hospital networks face severe fragmentation in coordinating patient care across departments. A cardiac patient undergoing surgery, post-operative monitoring, pharmacy, physiotherapy, and dietician consultations requires dozens of handoffs — each currently managed through phone calls, paper notes, and disconnected EMR messages. Nurses spend up to 35% of their shift on coordination activities rather than direct care. Missed handoffs lead to medication errors, delayed discharges, increased length-of-stay costs, and in the worst cases, adverse patient events. Hospital leadership lacks real-time visibility into bed occupancy, pending orders, and care plan adherence across departments.

Objective:

Build a ServiceNow-based clinical care coordination platform that digitizes patient care handoffs, automates task assignments to nursing, pharmacy, radiology, and dietary teams, tracks care plan milestone completion in real time, and provides charge nurses and hospital operations with live dashboards to reduce preventable delays.

Elements to include in Design:

- **Task Management (sn_hw_task)** – Clinical Task Records
- **Flow Designer** – Care Handoff Automation
- **Service Portal (sp_portal)** – Patient-Facing Care Plan Widget
- **Scripted REST APIs** – EMR Integration
- **Business Rules & Escalation Policies**
- **Performance Analytics (PA)** – Bed Management Dashboard
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**

Data Privacy & FERPA Compliance Request Management

Background:

Universities are bound by FERPA, GDPR, state privacy laws, and internal data governance policies regarding the collection, storage, sharing, and deletion of student and employee data. Data subject access requests (DSARs), data deletion requests, consent management, and privacy incident reports currently arrive via email with no structured intake, tracking, or deadline enforcement. Privacy officers manage these requests manually, risking regulatory violations, inconsistent responses, and missed statutory deadlines that can result in significant financial and reputational consequences.

Objective:

Create a ServiceNow data privacy and FERPA compliance management platform that standardizes intake for all privacy-related requests, automates routing and response workflows, tracks statutory deadlines, manages consent records, and provides privacy leadership with a real-time compliance dashboard.

Elements to include in Design:

- Privacy Request Portal:** Structured intake forms for DSARs, deletion requests, consent changes, and privacy inquiries
- Case Management:** Privacy case lifecycle tracking from intake through verification, fulfillment, and closure
- Deadline Automation:** Statutory response deadline tracking with escalation alerts for approaching and overdue cases
- Consent Management Records:** Custom tables tracking data subject consent status by processing purpose
- Privacy Incident Workflow:** Structured intake and response process for potential data breaches or unauthorized disclosures
- Cross-Department Routing:** Automated task assignment to data owners across IT, HR, financial aid, and academic departments
- Compliance Dashboard:** Open request volumes, deadline compliance rates, incident trends, and risk indicators
- ServiceNow AI Agents**

Omnichannel Store Operations & Customer Complaint Resolution

Background:

A national retail chain operating 500+ stores across formats and digital channels faces a growing crisis in customer complaint management. Complaints arrive through 11 different channels — store staff, call centre, email, social media, chatbot, and marketplace seller portals — and are handled by different teams with no unified view. A customer who complains about a defective product purchased online, exchanged in-store, and followed up via social media has their case siloed across three systems. Resolution rates are low, repeat contacts are high, and regional managers have no visibility into store-level complaint trends.

Objective:

Design a ServiceNow omnichannel retail operations platform that consolidates customer complaints from all channels into a single case management system, routes cases intelligently to store managers or central teams, enforces resolution SLAs, and provides retail operations leadership with store-level and category-level analytics.

Elements to include in Design:

- **Customer Service Management (CSM)** – Consumer Case
- **CSM Omnichannel Framework** – Channel Integrations
- **Assignment Rules & Queues**
- **Flow Designer**
- **SLA Definitions** – Category-Based Targets
- **Surveys** – Post-Resolution NPS
- **Performance Analytics** –
- **Custom Tables**
- **Generative AI Controller** Retail Operations Dashboard
- **Virtual Agent Designer**

Clinical Trial Site Management & Regulatory Deviation Tracking

Background:

A global pharmaceutical company running Phase II and III clinical trials across 80 investigator sites in 12 countries faces critical challenges in site performance management, protocol deviation tracking, and regulatory submission coordination. Site initiation, monitoring visits, serious adverse event (SAE) reporting, data query resolution, and closeout activities are managed through spreadsheets, email chains, and a legacy EDC system that does not support workflow automation. Protocol deviations go unreported beyond mandated timelines, and the clinical operations team cannot get a real-time view of site performance across the trial portfolio.

Objective:

Develop a ServiceNow clinical trial site management platform that standardizes site activation workflows, tracks protocol deviations and corrective actions, manages monitoring visit findings, automates SAE reporting workflows, and provides clinical operations leadership with a real-time trial health dashboard.

Elements to include in Design:

- **App Engine Studio** – Clinical Trial App
- **Flow Designer** – Site Activation Milestones
- **Approval Engine** – Protocol Deviation Classification
- **Scoped Application REST API** – EDC Integration
- **Document Management**
- **Notifications & Escalations** – SAE Reporting Deadlines
- **Performance Analytics** – Trial Health Dashboard

Student On-Campus Employment Onboarding & Management Portal

Background:

Many universities employ thousands of students in roles ranging from library assistants to research aides and dining staff. Managing the onboarding process for these student employees is complex, involving background checks, training completions, payroll enrollment, role-specific orientations, and policy acknowledgments. Currently this process is handled via fragmented spreadsheets, email communications, and manual HR workflows, resulting in delays, incomplete onboarding, compliance gaps, and a poor experience for new student employees who often need to start quickly within an academic semester.

Objective:

Build a ServiceNow HR Service Delivery solution specifically designed for student employee onboarding that automates and tracks every step of the process from offer acceptance through first-day readiness. The system should ensure compliance, reduce HR team workload, and give student employees a clear, guided digital experience for completing their onboarding requirements.

Elements to include in Design:

- HR Service Portal:** Personalized onboarding checklist and task tracker for student employees
- Onboarding Workflows:** Automated task assignments to HR, payroll, IT, and departmental supervisors
- Document Management:** Digital forms for tax documents, policy acknowledgments, and NDAs
- Service Catalog:** Self-service requests for ID cards, system access, parking permits, and uniforms
- Notifications:** Reminders for incomplete tasks with escalation to HR coordinators
- Reporting Dashboard:** HR team view of onboarding completion rates, bottlenecks, and compliance status
- NowAssist for HRSD and Virtual Agent**
- Knowledge Base:** FAQs, policy guides, and orientation materials for new student employees

Industry / Sector

Retail Banking Customer Onboarding & KYC Compliance Management

Background:

A large retail bank processing 50,000 new account applications monthly faces severe operational bottlenecks in customer onboarding and KYC compliance. Applications arrive through branches, mobile app, and third-party aggregators, triggering manual document collection, identity verification, AML screening, and credit assessment processes spread across 6 teams. Incomplete applications sit idle for days without customer notification. KYC re-verification for existing customers is tracked on spreadsheets, creating regulatory risk as reviews lapse undetected.

Objective:

Build a ServiceNow-powered retail banking onboarding and KYC compliance management platform that automates document collection, routes applications through verification and approval stages, tracks KYC review cycles, manages SAR filing workflows, and provides compliance leadership with real-time dashboards of onboarding pipeline health and regulatory risk exposure.

Elements to include in Design:

- **Customer Service Management (CSM)** – Account Application Case
- **Service Catalog** – Onboarding Request Types
- **Flow Designer** – Risk-Based Due Diligence Routing
- **Integrated Risk Management (IRM)** – KYC Compliance Register
- **Integration Hub** – AML & Identity Verification
- **Scoped Application** – SAR Case Management
- **Performance Analytics** – Compliance Dashboard
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**

Forest Operations Management & Sustainable Harvest Planning

Background:

A large timberland investment management organization managing 2 million acres of working forest across multiple states struggles to coordinate harvest planning, environmental compliance, contractor management, and land asset maintenance across geographically dispersed operations. Harvest plans are managed in GIS tools and spreadsheets with no integration to procurement, contractor scheduling, or regulatory permit tracking. Environmental compliance events are tracked manually by field foresters who have no mobile tools.

Objective:

Create a ServiceNow forest operations management platform that digitizes harvest planning workflows, manages environmental compliance events, coordinates contractor scheduling, tracks silviculture prescriptions, and provides regional and executive leadership with a unified operations dashboard accessible from mobile devices in the field.

Elements to include in Design:

- **App Engine Studio** – Forest Operations Scoped App
- **Service Catalog & Flow Designer** – Harvest Plan Approval
- **ServiceNow Mobile App** – Field Forester App
- **Asset Management** – Forest Road Infrastructure
- **Integrated Risk Management (IRM)** – Environmental Compliance Register
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**

Industry / Sector

Election Administration & Polling Station Operations Management

Background:

National and state election commissions managing large-scale elections face enormous operational complexity across voter registration, polling station staffing, ballot logistics, real-time incident management, and results reporting. During election day, thousands of polling stations submit issues through phone calls to overwhelmed command centres. Responses are uncoordinated and untracked, and post-election audit trails are incomplete. Managing the training, credentialing, and deployment of tens of thousands of polling officers is done via spreadsheets and postal communications.

Objective:

Build a ServiceNow election operations management platform that digitizes polling officer recruitment and training, manages pre-election logistics, provides a real-time election day incident command centre, and generates comprehensive post-election audit reports for transparency and legal compliance.

Elements to include in Design:

- **App Engine Studio** – Election Operations Scoped App
- **HR Service Delivery (HRSD)** – Officer Recruitment & Onboarding
- **Service Portal** – Polling Station Readiness Checklist Widget
- **Major Incident Management** – Election Day Command Centre
- **Now Mobile** – Field Supervisor App
- **Chain-of-Custody Tracking** – Integration Hub & QR Codes
- **Performance Analytics** – Election Command Dashboard
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**

Technology

Industry / Sector

National Census Data Collection & Field Enumerator Management

Background:

National statistics bureaus conducting census exercises must deploy tens of thousands of field enumerators to collect household-level demographic data across urban, rural, and remote geographies. Current operations rely on paper questionnaires, manual data entry, and phone-based supervision that cannot ensure coverage quality or data integrity. Enumerator performance varies widely — some households are missed, others double-counted — and supervisors have no real-time visibility into coverage progress or data quality issues.

Objective:

Develop a ServiceNow-based census operations management platform that manages enumerator recruitment and training, tracks geographic coverage in real time, manages non-response follow-up workflows, handles resident appeals, and provides census bureau leadership with a live operations dashboard showing coverage progress and data quality metrics.

Elements to include in Design:

- **App Engine Studio** – Census Operations Scoped App
- **Now Mobile** – Enumerator Field App
- **Flow Designer** – Non-Response Follow-Up Automation
- **Data Quality Management** – Business Rules & Scripted Validation
- **Service Portal** – Resident Appeal Portal
- **Performance Analytics** – Coverage Tracking Dashboard
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**

Industry / Sector

Live Event & Concert Operations Management Platform

Background:

A major live entertainment company producing 200+ concerts and music festivals annually struggles to coordinate the dozens of operational workstreams required for each event. Production planning, artist rider fulfillment, vendor contracting, venue coordination, ticketing reconciliation, security credentialing, and post-show settlement are managed through email threads and disconnected spreadsheets. Critical tasks are missed — artist technical riders go unfulfilled, security contractor certifications expire, and post-event vendor payments are delayed due to missing settlement documentation.

Objective:

Design a ServiceNow live event operations platform that provides a structured project management framework for each concert, coordinates fulfillment across production, logistics, security, and hospitality teams, manages vendor and artist contracts, tracks credentialing for all event personnel, and gives operations leadership a consolidated view of event portfolio health.

Elements to include in Design:

- **App Engine Studio** – Event Operations Scoped App
- **Service Catalog** – Artist Rider & Vendor Request Items
- **Flow Designer** – Post-Event Settlement Automation
- **Credential & Access Management** – Custom Table + QR Workflow
- **Vendor Management** – Contract Repository with Alerts
- **Performance Analytics** – Event Portfolio Dashboard
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**

Hospital-Wide Biomedical Asset Management & Equipment Lifecycle

Background:

A 1,200-bed multi-speciality hospital operates over 15,000 biomedical and clinical assets — ventilators, infusion pumps, ECG machines, surgical robots, and imaging equipment — across 40 departments. Asset maintenance is coordinated using paper-based preventive maintenance schedules and reactive breakdown calls via phone. Critical equipment downtime during active patient care causes clinical disruptions and patient safety risks. Joint Commission PM compliance rates are tracked manually and frequently miss deadlines.

Objective:

Implement a ServiceNow Healthcare Asset Management platform that maintains a complete, auditable inventory of all biomedical assets, automates preventive maintenance scheduling, manages breakdown incident response, tracks warranty and contract coverage, enforces regulatory PM compliance, and provides hospital leadership with a capital planning dashboard.

Elements to include in Design:

- **IT Asset Management (ITAM)** – Biomedical Asset CI Records
- **Planned Maintenance** – PM Schedule Automation
- **Incident Management** – Equipment Breakdown Reporting
- **Regulatory Compliance Tracking**
- **Contract Management** – Warranty & Service Contracts
- **Flow Designer** – Loaner Equipment Coordination
- **Performance Analytics** – Capital Planning Dashboard
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**

Performing Arts Theatre Operations & Production Management System

Background:

A performing arts organization managing a 1,800-seat theatre and a touring division producing 12 major productions annually faces significant operational fragmentation. Production management, technical crew scheduling, costume and props inventory, rehearsal room booking, front-of-house operations, and subscription patron services are each managed through separate tools and informal communication. Technical rehearsals run over schedule due to uncommunicated set-change conflicts. Front-of-house staff have no structured process for handling patron complaints or accessibility requests.

Objective:

Create a ServiceNow theatre operations platform that centralizes production planning workflows, manages technical crew scheduling, tracks costume and props inventory, handles patron services requests, and provides the artistic and operations director with a single dashboard for all active productions.

Elements to include in Design:

- **App Engine Studio** – Theatre Operations Scoped App
- **Project & Portfolio Management (SPM)** – Production Planning
- **Resource Management (SPM)** – Crew Scheduling
- **Service Portal** – Patron Services Portal
- **Inventory Management** – Costume & Props Tracking
- **Performance Analytics** – Production Health Dashboard
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**

Shopping Mall Operations, Tenant Services & Visitor Experience Management

Background:

A large mixed-use shopping and entertainment complex with 350 tenant units, 8 anchor stores, 4 food courts, multiplex cinemas, and a hypermarket receives thousands of daily visitors. Tenant complaints about common area maintenance, requests for additional signage, loading dock reservations, and marketing participation are submitted via phone and email to an understaffed operations team. Visitor complaints — lost and found, safety incidents, parking issues — are handled inconsistently. Mall management has no consolidated view of tenant satisfaction, maintenance backlog, or visitor experience quality.

Objective:

Build a ServiceNow shopping mall operations platform that provides tenants with a self-service portal for all service requests and maintenance reporting, manages visitor experience cases, coordinates facility maintenance workflows, tracks tenant lease milestones, and gives mall operations leadership a unified dashboard of property health and tenant satisfaction.

Elements to include in Design:

- **Customer Service Management (CSM)** – Tenant & Visitor Cases
- **Service Portal** – Tenant Self-Service Hub
- **Flow Designer** – Visitor Lost & Found Workflow
- **Asset Management** – Lease Milestone Tracking
- **Surveys** – Tenant Satisfaction Surveys
- **Performance Analytics** – Mall Operations Dashboard
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**

Industry / Sector

Cybersecurity Incident Response & Vulnerability Management Platform

Background:

University IT and cybersecurity teams face a constant stream of security threats including phishing attacks, malware incidents, unauthorized access attempts, and data breaches. Responding to these incidents requires coordinated action across multiple teams — IT security, network operations, legal, communications, and executive leadership. Currently, incident response is ad hoc with no standardized playbooks, inconsistent communication, and manual threat tracking in spreadsheets. Additionally, vulnerability scan results from tools like Nessus or Qualys are not systematically prioritized or tracked to remediation, leaving known vulnerabilities open for extended periods.

Objective:

Design a ServiceNow Security Operations (SecOps) platform for a university that automates security incident response, manages vulnerability remediation, and provides security leadership with real-time risk visibility. The system should enforce consistent response procedures, reduce mean time to detect and respond (MTTR), and ensure that critical vulnerabilities are remediated within defined SLAs.

Elements to include in Design:

- Security Incident Response:** Structured playbooks for phishing, malware, data breach, and unauthorized access scenarios
- Vulnerability Response:** Automated ingestion and prioritization of vulnerability scan findings with remediation tracking
- Threat Intelligence:** Integration hooks for external threat feeds to enrich incident context
- Assignment Rules:** Auto-routing of security incidents and vulnerabilities to responsible teams based on system/asset ownership
- SLA Tracking:** Response and remediation time targets with escalation for overdue items
- Dashboards:** Security risk posture view showing open incidents, vulnerability age, MTTR trends, and compliance status
- Post-Incident Reviews:** Structured process for documenting lessons learned and updating response playbooks

Consumer Electronics Warranty Claim & Repair Lifecycle Management

Background:

A global consumer electronics manufacturer handling 2 million warranty and out-of-warranty repair claims annually through 5,000 authorized service centres across 60 countries faces systemic failures in claim management. Customers experience inconsistent eligibility checks, long wait times for parts, and no visibility into repair status. Service centres use paper job cards and phone-based spare parts ordering. Fraudulent warranty claims cost the company millions annually.

Objective:

Design a ServiceNow consumer electronics warranty and repair management platform that provides customers with a digital claim portal, automates eligibility verification, manages spare parts ordering, tracks repair job progress, processes service centre reimbursements, and delivers analytics to identify fraud patterns and product quality trends.

Elements to include in Design:

- **Customer Service Management (CSM)** – Warranty Claim Case
- **Service Portal** – Customer Warranty Claim Portal
- **Integration Hub** – IMEI Verification & Parts Ordering
- **Fraud Detection** – Business Rules & Scripted Logic
- **Flow Designer** – Service Centre Reimbursement Workflow
- **Customer Surveys & Notifications** – Post-Repair NPS
- **Performance Analytics** – Warranty Operations Dashboard
- **Custom Tables**
- **Generative AI Controller**

Dark Store Operations & Last-Mile Delivery Issue Resolution Platform

Background:

A rapid grocery delivery company operating 200 dark stores promising 10-minute delivery across 15 cities handles 150,000 orders daily. Operational failures generate 8,000+ customer complaints daily, handled by a 500-agent contact centre using a basic ticketing tool. Delivery partners have no structured channel to report operational issues. Dark store managers lack tools to track inventory discrepancies, equipment breakdowns, and picker performance issues. Leadership cannot correlate complaint spikes with specific dark stores or delivery zones.

Objective:

Build a ServiceNow quick commerce operations management platform that unifies customer complaint resolution, manages delivery partner incident reporting, tracks dark store operational issues, automates refund and reorder workflows, and provides operations leadership with real-time store-level and zone-level performance dashboards.

Elements to include in Design:

- **Customer Service Management (CSM)** – Order Complaint Cases
- **Flow Designer** – Automated Resolution Engine
- **Service Portal & Now Mobile** – Delivery Partner Reporting App
- **App Engine Studio** – Dark Store Operations Module
- **Field Service Management (FSM)** – Equipment Maintenance Dispatch
- **SLA Definitions & Escalation Policies**
- **Performance Analytics** – Operations Command Dashboard
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**

Oilfield Asset Integrity & HSE Incident Management Platform

Background:

An integrated oil and gas company operating onshore and offshore production assets faces challenges in managing asset integrity, HSE incidents, permit-to-work processes, and regulatory compliance. Corrosion inspection findings, pressure vessel certifications, and pipeline integrity assessments are tracked in paper records. HSE incidents are reported through email with no standardized root cause analysis process. The permit-to-work system is paper-based and prone to concurrent work conflicts that create explosion and toxic gas exposure risks.

Objective:

Develop a ServiceNow asset integrity and HSE management platform that digitizes the permit-to-work process, manages integrity inspection findings with risk-ranked remediation tracking, standardizes HSE incident reporting with root cause analysis, enforces regulatory compliance timelines, and provides operations and HSE leadership with a real-time risk dashboard.

Elements to include in Design:

- App Engine Studio** – Asset Integrity & HSE Scoped App
- CMDB** – Asset Integrity Register
- Flow Designer** – Digital Permit to Work (PTW)
- Integrated Risk Management (IRM)** – Regulatory Compliance Framework
- Incident Management** – HSE Incident Reporting
- Now Mobile** – Field Inspection & Incident Reporting
- Performance Analytics** – Asset Risk & HSE Dashboard
- Custom Tables**
- Generative AI Controller**
- Virtual Agent Designer**

Environmental Regulatory Compliance & Pollution Incident Response

Background:

A national environmental protection agency responsible for monitoring industrial emissions, water quality, solid waste management, and EIA approvals across thousands of regulated facilities struggles with fragmented enforcement. Pollution complaints from citizens arrive with no structured triage or field inspection assignment. Regulated facilities submit compliance reports through postal mail. EIA applications queue for months due to manual review coordination. Enforcement actions lack structured legal case tracking, and penalties go uncollected due to missed follow-up.

Objective:

Create a ServiceNow environmental compliance and enforcement management platform that digitizes pollution complaint intake, automates field inspection assignment, manages EIA application review workflows, tracks facility compliance reporting, coordinates enforcement case management, and gives agency leadership a real-time environmental risk dashboard.

Elements to include in Design:

- **App Engine Studio** – Environmental Compliance Scoped App
- **Service Portal** – Public Citizen Complaint Portal
- **Field Service Management (FSM)** – Inspection Dispatch
- **Flow Designer** – EIA Multi-Disciplinary Review
- **Integrated Risk Management (IRM)** – Facility Compliance Monitoring
- **Legal Service Delivery** – Enforcement Case Management
- **Performance Analytics** – Environmental Risk Dashboard

University IT Helpdesk Modernization & Student Tech Support

Background:

University IT departments support thousands of students, faculty, and administrative staff across diverse technology environments including learning management systems, lab computers, Wi-Fi infrastructure, and enterprise applications. Currently, support requests arrive through multiple uncoordinated channels — walk-ins, phone calls, emails — making it difficult to track workloads, measure resolution times, or identify recurring problems. Students experience long wait times and have no visibility into their request status. IT staff lack consolidated tools to manage incidents, access knowledge, or identify patterns for proactive problem resolution.

Objective:

Design and implement a ServiceNow ITSM solution tailored for a university IT helpdesk that unifies all support channels, automates ticket routing, enables self-service, and provides comprehensive reporting. The goal is to reduce resolution times, improve student satisfaction, and give IT leadership actionable data to optimize operations and prevent recurring issues.

Elements to include in Design:

- Incident Management:** Full lifecycle management for IT issues from intake to closure
- Service Catalog:** Student-facing menu of IT services (software requests, account access, device support)
- Self-Service Portal:** Search-enabled interface for students to submit and track tickets independently
- Knowledge Base:** Searchable articles for common issues (password resets, VPN setup, printing)
- Problem Management:** Root cause analysis module to identify and eliminate recurring incidents
- SLA Management:** Service level tracking with automated escalations for breached tickets
- NowAssist for ITSM and Virtual Agent**
- Reporting & Dashboards:** Metrics on volume, resolution times, satisfaction scores, and top issue categories

Pharmacovigilance & Adverse Drug Reaction Case Management

Background:

A global pharmaceutical company marketing 40+ products across 100 countries is legally required to collect, assess, and report adverse drug reactions (ADRs) to health authorities within strict timelines — 7 days for fatal/life-threatening events, 15 days for other serious cases. ADR cases arrive through multiple channels and are manually triaged in an email-based intake system. Case processing is slow, data fields are inconsistently populated, and regulatory submission deadlines are tracked on spreadsheets. Missed reporting timelines have resulted in warning letters from the FDA and EMA.

Objective:

Build a ServiceNow pharmacovigilance case management platform that provides structured, channel-agnostic ADR intake, automates case triage and medical coding workflows, enforces regulatory reporting timelines with real-time deadline tracking, manages signal detection follow-up, and delivers compliance dashboards for the global drug safety team.

Elements to include in Design:

- **App Engine Studio** – Pharmacovigilance Scoped App
- **Integration Hub** – Multi-Channel Case Intake
- **Flow Designer** – Regulatory Deadline Enforcement
- **Approval Engine** – Medical Officer Case Assessment
- **Virtual Agent (Now Assist)** – Internal Case Query Resolution
- **Scripted REST API** – E2B Regulatory Submission
- **Performance Analytics** – Global Safety Compliance Dashboard
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**

Insurance Claims Processing & Fraud Investigation Management

Background:

A large general insurance company processing 500,000 claims annually across motor, health, property, and liability lines faces a claims lifecycle rife with inefficiency and fraud. Claims arrive through agents, direct portal, and third-party aggregators and are routed manually to surveyors, legal teams, and settlement desks. Motor claims face average cycle times of 28 days. Fraud detection is entirely manual and retrospective. Customer communication is minimal until the settlement stage, generating thousands of avoidable inbound status calls.

Objective:

Design a ServiceNow insurance claims management platform that automates claims intake and routing, manages surveyor assignment and field inspection, tracks repair and replacement workflows, enforces SLA-driven settlement timelines, integrates fraud detection triggers, and provides claims leadership with a real-time performance dashboard.

Elements to include in Design:

- **Customer Service Management (CSM)** – Insurance Claim Case
- **Service Portal** – Digital FNOL Submission
- **Field Service Management (FSM)** – Surveyor Dispatch
- **Flow Designer** – Fraud Detection & Fast-Track Routing
- **Approval Engine** – Settlement Authority Limits
- **Notifications & Virtual Agent** – Customer Self-Service Status
- **Performance Analytics** – Claims Operations Dashboard
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**

Public Health Disease Surveillance & Outbreak Response Management

Background:

A state public health department responsible for disease surveillance, outbreak investigation, and immunization program management across a population of 20 million struggles with fragmented data and slow response times. Notifiable disease reports from hospitals, labs, and clinics arrive via fax, phone, and email with inconsistent data quality. Outbreak investigation teams coordinate through phone calls and email with no structured case assignment. Contact tracing during outbreak events is managed on spreadsheets that cannot scale during peaks.

Objective:

Build a ServiceNow public health management platform that standardizes notifiable disease case intake, automates outbreak investigation workflows, manages contact tracing at scale, coordinates immunization campaign logistics, tracks AEFI reports, and provides public health leadership with a real-time epidemiological surveillance dashboard.

Elements to include in Design:

- **App Engine Studio** – Public Health Scoped App
- **Integration Hub** – Lab & Facility Reporting
- **Flow Designer** – Outbreak Investigation Workflow
- **Contact Tracing Management** – Scalable Case Assignment
- **Mobile App (Now Mobile)** – Field Epidemiology & Immunization
- **Planned Maintenance** – Immunization Campaign Scheduling
- **Performance Analytics** – Epidemiological Surveillance Dashboard
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**

Supermarket & Hypermarket Store Operations & Food Safety Management

Background:

A hypermarket chain operating 180 stores with fresh produce, bakery, deli, seafood, and ready-to-eat departments must maintain rigorous food safety standards while managing complex daily operations across thousands of SKUs. Food safety compliance — temperature logging, shelf-life checks, cleaning schedules, pest control — is managed through paper checklists. Equipment failures are reported via phone with no structured maintenance tracking. Recall management for affected products relies on manual store communications and takes hours, creating regulatory and reputational risk.

Objective:

Develop a ServiceNow supermarket operations and food safety management platform that digitizes daily compliance checklists, manages equipment maintenance and breakdown response, automates product recall workflows, tracks supplier quality issues, and provides food safety and operations leadership with chain-wide compliance dashboards.

Elements to include in Design:

- **App Engine Studio** – Food Safety Scoped App
- **Now Mobile** – Digital Food Safety Checklist Completion
- **Flow Designer** – Product Recall Broadcast Workflow
- **Field Service Management (FSM)** – Equipment Maintenance & Breakdown
- **Supplier Quality Management** – Workflow & Corrective Action
- **Surveys & Audit Management** – Internal Food Safety Audits
- **Performance Analytics** – Food Safety Compliance Dashboard
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**

Mining Operations – Contractor Safety & Production Performance Management

Background:

A large open-cut and underground mining operation employing 4,000 direct employees and 3,000 contractor personnel across 6 mine sites faces challenges in contractor safety management, equipment availability, shift production reporting, and regulatory compliance. Contractor pre-qualification, induction tracking, and site access control rely on paper records. Production shift reports are compiled manually with 4-hour delays. Ground control events, near misses, and equipment damage incidents lack structured classification and investigation.

Objective:

Create a ServiceNow mining operations management platform that digitizes contractor safety pre-qualification and induction, manages site access control, automates production shift reporting and variance alerts, standardizes safety incident investigation workflows, and provides mine site general managers and executive leadership with real-time production and safety dashboards.

Elements to include in Design:

- **App Engine Studio** – Mining Operations Scoped App
- **Service Portal** – Contractor Pre-Qualification Portal
- **HR Service Delivery (HRSD)** – Induction Onboarding Checklist
- **Flow Designer** – Automated Shift Production Reporting
- **Incident Management** – Safety Incident Investigation
- **Now Mobile** – Ground Control Event Management
- **Performance Analytics** – Mine Operations Command Dashboard
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**

Airport Infrastructure Maintenance & Airside Operations Safety Management

Background:

A major international airport hub handling 60 million passengers annually operates across landside and airside zones with thousands of critical assets — runway lighting systems, jet bridges, baggage handling equipment, and fire suppression systems. Maintenance teams manage work orders through paper job cards and phone calls. Planned preventive maintenance schedules for safety-critical airside assets are tracked on spreadsheets. When a critical asset like a jet bridge fails, there is no structured rapid-response dispatch system, causing flight delays. Safety incidents — FOD discoveries, fuel spills, apron vehicle incidents — are reported via radio with no structured investigation workflow.

Objective:

Build a ServiceNow Airport Maintenance and Safety Management platform that digitizes all planned and reactive maintenance for airside and landside assets, enforces CAA-mandated maintenance compliance intervals, provides rapid-response dispatch for critical airside failures, manages FOD and safety incident investigations, coordinates multi-party contractor work permissions, and delivers operational dashboards for Airport Operations Centre leadership.

Elements to include in Design:

- **App Engine Studio** – Airport Maintenance Scoped App
- **Planned Maintenance** – CAA Compliance Scheduling
- **Flow Designer**
- **Safety Incident & FOD Management** – Incident Management
- **Contractor Management** – Pre-Authorization & Permit Tracking
- **Performance Analytics** – Airport Operations Centre Dashboard
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**

Urban Traffic Incident Management & Public Transport Operations Coordination

Background:

A metropolitan transport authority managing a city of 5 million residents coordinates road traffic operations, public bus and rail network management, traffic signal infrastructure, and emergency incident response across 12,000 km of road network and 400 public transport routes. Traffic incidents are reported through a fragmented system with no unified incident log. When a major road accident blocks a key arterial route, there is no structured process to simultaneously reroute bus routes, divert highway traffic, notify the public, dispatch maintenance crews, and coordinate with police and ambulance services.

Objective:

Develop a ServiceNow Urban Traffic and Transport Operations Management platform that provides the Traffic Management Centre with a unified incident command workspace, automates multi-agency coordination workflows for major traffic events, manages public transport disruption response, tracks traffic signal infrastructure maintenance, enables citizen incident reporting, and delivers a real-time operational dashboard for the Transport Commissioner.

Elements to include in Design:

- **App Engine Studio** – Transport Operations Scoped App
- **Major Incident Management** – TMC Command Workspace
- **Flow Designer** – Multi-Agency Coordination Automation
- **Service Portal** – Citizen Traffic Incident Reporting
- **CMDB & Planned Maintenance** – Traffic Signal Infrastructure Management
- **Now Mobile** – Field Officer & Maintenance App
- **Performance Analytics** – Transport Commissioner Dashboard
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**

End-to-End Food Supply Chain Traceability, Quality & Recall Management

Background:

A large food and beverage conglomerate operating across farming, processing, cold chain logistics, distribution, and retail supply faces critical challenges in food safety traceability, supplier quality management, and product recall execution. The company sources raw materials from 800+ farms and ingredient suppliers across 30 countries and distributes to 45,000 retail points. When a food safety alert occurs, the company's ability to execute a targeted recall is severely limited — traceability from farm to shelf requires manual cross-referencing of production batch records, quality inspection reports, cold chain temperature logs, and retail distribution records — a process that takes 72+ hours when regulators require action within 24 hours.

Objective:

Build a ServiceNow Food Supply Chain Traceability and Quality Management platform that creates a unified batch traceability record linking farm inputs through production to retail distribution, automates supplier quality incident and corrective action management, orchestrates rapid multi-tier product recall workflows, enforces cold chain compliance monitoring, and delivers supply chain risk and quality analytics to the Chief Food Safety Officer.

Elements to include in Design:

- **App Engine Studio** – Food Supply Chain Scoped App
- **Integration Hub** – ERP, WMS & Cold Chain Data Integration
- **Flow Designer** – Rapid Recall Orchestration
- **Supplier Quality Management** – Corrective Action Workflow
- **Supplier Risk Scoring** – Scripted Business Rules & PA
- **Cold Chain Compliance** – IoT Integration & Incident Management
- **Performance Analytics** – Food Safety & Supply Chain Dashboard
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**

Luxury Hotel Operations Management, Guest Services & Facilities Maintenance

Background:

A luxury hotel group operating 35 five-star properties across 20 countries with an average of 450 rooms per property faces significant operational fragmentation in guest experience delivery, facilities maintenance, and inter-department service coordination. Each hotel runs as an operational silo with different tools for housekeeping, maintenance request tracking, guest complaint handling, concierge service coordination, and vendor management. Guests expect seamless, proactive service — yet guest requests are communicated to housekeeping via radio, maintenance issues are written on paper, and complaints reach different staff members with no visibility into prior history.

Objective:

Design a ServiceNow Luxury Hotel Operations Management platform that provides a unified guest service request and complaint management system, automates housekeeping and engineering task dispatch, manages preventive maintenance for all hotel assets with regulatory compliance tracking, coordinates vendor service delivery, enables cross-property operational benchmarking, and gives General Managers a real-time property health dashboard.

Elements to include in Design:

- **App Engine Studio** – Hotel Operations Scoped App
- **Service Portal** – Guest-Facing Digital Concierge
- **Flow Designer** – Intelligent Task Dispatch & Escalation
- **Customer Service Management (CSM)** – Guest Complaint Case Management
- **CMDB & Planned Maintenance** – Hotel Asset Lifecycle
- **Vendor & Contractor Management** – Delivery Confirmation Workflow
- **Performance Analytics** – Property Operations Dashboard
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**

National School Meals Programme – Supply, Quality & Nutrition Compliance Management

Background:

A government-run National School Meals Programme provides daily nutritious meals to 8 million school children across 40,000 schools. The programme operates through a network of 200 regional catering contractors and 1,500 local kitchen operators. Kitchen operators receive food commodities by truck with no structured delivery confirmation or quality inspection process — short-weight deliveries and diversion of commodities are known issues with no systematic detection. Meal quality and nutrition compliance are monitored through surprise visits by district nutrition inspectors who complete paper forms that take weeks to aggregate. Complaints from headteachers and parents are submitted informally with no tracking or resolution accountability.

Objective:

Build a ServiceNow National School Meals Programme management platform that digitizes commodity delivery verification, automates kitchen quality inspection workflows, manages complaint and foodborne illness incident response, tracks supplier non-conformances with corrective actions, enables headteacher and parent feedback, and provides the Programme Director and state nutrition officials with a real-time compliance and quality dashboard to improve accountability and reduce programme leakage.

Elements to include in Design:

- **App Engine Studio** – School Meals Programme Scoped App
- **Now Mobile** – Kitchen Operator Delivery Confirmation App
- **Flow Designer** – Nutrition Inspector Workflow & Scheduling
- **Service Portal** – Headteacher & Parent Feedback Portal
- **Incident Management & Flow Designer** – Foodborne Illness Response
- **Supplier Non-Conformance & CAPA** – Corrective Action Workflow
- **Performance Analytics** – Programme Director & State Dashboard
- **Custom Tables**
- **Generative AI Controller**
- **Virtual Agent Designer**
